Assumptions:

1. Users can only add book if book is not in BookClub database
2. The authors in the BookClub database may have not written any books
3. A user can have multiple shelves
4. Each book can be stored in multiple shelves, ie. a book can be both non-fiction and computers
5. User can be friends only if Friendship_Status == True for both users
6. Users can only search other shelves if Friendship_Status == True between both users
7. Each user can only log book as read once
8. Each review and its user-author is associated with exactly one book
9. A user many review a book at most once
10. Comments may optionally reference another comment, allowing hierarchical discussion threads to be reconstructed.
11. Aggregate values such as ‘Average_Ranking’, ‘Like_Count’, and 'Comment_Count’ are derived attributes that are not stored.
12. Books have summaries attached to them
